Clinical manifestations of acute and recurrent mesenteric ischemia in seven cats. Mesenteric ischemia was diagnosed in 7 cats with acute clinical signs that were characterized by signs consistent with intestinal ischemia. The source of the mesenteric thromboemboli was reported to be the left-sided cephalic vein in 4 cats. Two cats were euthanized because of progressive signs of intestinal ischemia, 1 cat had a good recovery, and the last cat survived for 18 days after diagnosis. In the last cat, thromboembolic lesions could be seen in the abdominal aorta and nonocclusive thrombi were found in other vessels.

Boris Johnson has been urged to call an immediate general election in an attempt to reduce the number of people dying of coronavirus. Labour leader Sir Keir Starmer and health minister Matt Hancock have joined forces to appeal to the Prime Minister to call an election to tackle the coronavirus pandemic. And they want a new parliament to be in place on 8 May, in order to provide the ideal conditions to fight Covid-19. Coronavirus: Sir Keir Starmer and Matt Hancock call for an early general election to 'rebuild the country' during lockdown Mr Starmer believes the election should be used as a 'wonderful opportunity' to help the country overcome the current crisis. 'We can work with the care services to make sure we have nursing homes

AdvertisementsA new approach to modifying secondary stability in total knee arthroplasty. Secondary total knee arthroplasty (TKA) is a reconstructive procedure that aims at restoring the preoperative mechanical axis and improving the tibiofemoral stability. Usually, the femoral component is too deep, resulting in instability due to soft tissue deficiency, and too shallow, leading to a loss of postoperative flexion. In this study, a new TKA technique was used to modify the resection and soft tissue tension in a cadaveric model and the effect of the prosthetic design on tibiofemoral stability and flexion was analyzed. In TKA, the mechanical axis was corrected. Then, the tibial component was shortened. The main advantage of this technique was that the femoral component was more proximal, resulting in more medial soft tissue tension, which prevented overflexion of the knee. Inhibition of lectin-induced lymphocyte proliferation by the white root extract of *Manilkara zapota*. This study was carried out to isolate and purify the components responsible for the immunosuppressive action of the methanolic extract of the root of *Manilkara zapota*. The methanol extract was fractionated by column chromatography. The high-performance liquid

---

chromatography fraction containing lectin (fraction I) was purified by gel filtration on Sephadex G-100. This study was designed to investigate the immunostimulatory and immunosuppressive effect of the isolated lectin. Human peripheral blood lymphocytes (PBLs) in the presence of lectin (fraction I) and concanavalin A (ConA) were used to study the immunostimulatory effect. Interleukin 2 (IL-2) level in the culture supernatant was measured by an enzyme-linked immunosorbent assay. The purified lectin from *M. zapota* suppressed the mitogenic activity of ConA. This inhibitory effect could be blocked by the treatment with actinomycin D, suggesting that the inhibition was mediated through a protein synthesis-dependent mechanism. The lectin also inhibited the blastogenic response of PBLs stimulated with allogeneic cells. Furthermore, the lectin suppressed the IL-2 production in the ConA-stimulated PBLs. The lymphocyte proliferation induced by phytohemagglutinin (PHA) was also suppressed by *M. z*
